RESEARCH INTERESTS	<p>My main interest is in the phenomenology of particle dark matter (DM). My primary focus has been on the direct detection of DM in underground laboratory experiments. I have previously demonstrated how the astrophysics and particle physics properties of a new DM particle could be robustly determined, and I continue to study novel signatures in the direct search for DM. With the advent of gravitational wave (GW) astronomy, I have begun focusing on the effects of DM on GWs from compact object mergers. In particular, I am interested in whether dense DM halos around black holes (both primordial and astrophysical) can be detected through their influence on merger rates and gravitational waveforms.</p>	
PUBLICATIONS (LIST ONLINE)	<p>70 publications (64 peer-reviewed). These include 5 single-author papers, 16 first-author papers, 1 paper published in <i>Nature Astronomy</i>, 7 papers published in <i>Physical Review Letters</i> and 7 contributions to White Papers.
