RESEARCH INTERESTS	My main interest is in the phenomenology of <i>particle dark matter</i> (DM). My primary focus has been on the direct detection of DM in underground laboratory experiments. I have previously demonstrated how the astrophysics and particle physics properties of a new DM particle could be robustly determined in the event of a discovery, and I continue to study novel signatures and new approaches in the direct search for DM. With the advent of gravitational wave (GW) astronomy, I have begun focusing on the effects of DM on GWs from compact object mergers. In particular, I am interested in whether dense DM halos around black holes (both primordial and astrophysical) can be detected through their influence on merger rates and gravitational waveforms.
